Customer-facing engineer: I take a real business problem, sit with the operator, and ship the solution, on five years of production backend and AI developer tooling.

EXPERIENCE

ArtAgain · Consulting Engineer Mar 2026 – Present

- Mapped the seller journey from first WhatsApp inquiry to Shopify listing with the staff doing the work, and surfaced the handoffs that lived only in chat messages and memory.
- Built the database, operator views, seller listing workspace and Shopify integration, refined with staff on real seller submissions. Listing an artwork went from three days to two hours.
- Asked for an AI valuation engine, I watched the pricing operator work first and shipped explicit filters with a note explaining each comparable; pricing stays with her. AI kept for the one question rules cannot answer: whether two auction photos show the same physical work.

Compliance screening engagement · Singapore financial institution Ongoing

- Independently engaged the compliance team, ran discovery with the people doing the screening, and mapped their onboarding, adverse-media screening, periodic review and audit workflow end to end.
- Built a working demo tailored to that workflow: screening runs per entity with evidence summaries, reviewer-recorded outcomes and rationale, a full run history for audit, risk ratings that set the next review date, and daily monitoring. The compliance team is championing it internally.

Crypto.com · Blockchain Engineer, Innovation Team Jun 2024 – Jul 2026

- Designed and built the Cronos AI SDK so developers could ship AI agents that act on the chain: LangChain and LangGraph integration, with on-chain tools built alongside the Cronos Explorer team.
- Led full-stack maintenance of the official Cronos website.

Starboard Ventures · Fullstack Blockchain Engineer Jun 2023 – Jun 2024

- Shipped Repl (now Parasail), a Filecoin DeFi protocol that reached **USD $15M TVL**: ERC-1822 UUPS upgradeable contracts with Hardhat, and the design of pFIL, a stETH-style rebasing token that pays yield without a staking step.
- Built the Next.js multisignature dashboard for proposing and approving Gnosis Safe transactions, and the FIL/pFIL wrapping app. Added Prisma migrations to CI/CD and a type-safe tRPC client-server layer.

Firerock Capital · Blockchain Engineer Jan 2022 – Jun 2023

- Cut Docker build time from **400 seconds to 10 seconds** by caching `go.mod` as its own layer and mounting the Go build cache.
- Built the Go OAuth service that let game players bind their social accounts (Redis, MongoDB); shipped the ERC-721/ERC-20 contracts and wired Wagmi, Web3Auth and Ethers.js into the marketplace frontend.

TikTok · Software Engineer, Video Architecture (VOD) Jan 2021 – Jan 2022

- Developed and maintained the core playback service handling **350k QPS**, with on-call support, and architected the video-metadata reconciliation service behind it (Go, RocketMQ, MySQL).
- Built Thrift RPC endpoints for internal users and scripted their configuration changes to shorten the turnaround.

PROJECTS

- **RightCurve**, an MCQ practice platform for Singapore O-Level and A-Level students, with Google Gemini giving question-specific explanations. Curated hundreds of MCQs aligned with the MOE syllabus.
- Also Minority Game, NFTracker, and NiftyRewards (3rd place, Web3Auth sponsor prize, ETHAmsterdam).

EDUCATION

Nanyang Technological University · Renaissance Engineering Programme 2017 – 2021

BEng (Hons) Computer Science, First Class; MSc Technology Management. **GPA 4.58/5.00.** REP Scholarship.

University of California, Berkeley · Junior exchange, computer science coursework 2019 – 2020

SKILLS

Programming: TypeScript / JavaScript (Node.js), Python, Go. **AI:** LangChain, LangGraph, Gemini.

Data and web: PostgreSQL, MySQL, Redis, MongoDB, React / Next.js, Docker.

Web3: Solidity, Ethers.js, Wagmi, Web3Auth. **Languages:** English (native), Chinese (conversational).
