EXPERIENCE

ArtAgain · Consulting Engineer Mar 2026 – Present

- The team asked for an AI valuation engine and an AR tool. I first sat with the three staff and mapped how a seller gets from a WhatsApp message to a live Shopify listing, asking who decides each step and when work passes to the next person. Some of it lived only in chat and in people's heads, so I put the valuation engine second and fixed the workflow first.
- As the only engineer, built the database, operator views and listing workspace, refined with the staff on real seller submissions, and kept Shopify as the place they already work. Its native Draft status replaced the manual Google Sheet, which the listings staff stopped using. **Listing an artwork went from two weeks to three days.**
- When its turn came, discovery showed the valuation engine wasn't the job. Sitting with the pricing staff, I watched her look up the artist in one auction database and filter by medium, edition, size and year; none of that needs a model. I rebuilt it as filters with a reason per match, kept AI for the one question rules can't answer, whether two auction photos show the same physical work, and left the price her decision.
- Built the "view on your wall" AR page for iPhone, showing a listed artwork on the buyer's wall at its recorded size.

Singapore Financial Institution · Consulting Engineer Jun 2026 – Present

- Ran discovery with the compliance team on KYC screening and mapped onboarding, adverse-media screening, periodic review and audit end to end, including which steps the front office runs and which stay with compliance. What they wanted was a human in the loop and every search visible, with Google as the source, because that is what their reviewers trust.
- Built a working prototype in under a week and reshaped it with the team step by step. Code runs the searches and decides the hard facts, a model judges each result, and the reviewer records the outcome and reason beside each party's Google results, with every run kept. A live run on 10 names and 20 searches took a median of 3 min 22 s per search at about US$0.51 a name, with 0 dangerous false hits in a 70-row check. The compliance team is championing it internally.

Crypto.com · Senior Software Engineer, Innovation Team Jun 2024 – Jul 2026

- Built the developer platform's TypeScript and Python clients with DeFi, exchange and CronosID modules, and co-maintained the TypeScript AI agent client; each TypeScript package sees **about 3,000 npm downloads a month** (Oct 2026).
- Worked on the AI agent's LangChain and LangGraph integration for multi-step tool use, with on-chain tools built alongside the Cronos Explorer team. After a conversation hit the model's 8,192-token limit, measured about 2,900 to 3,400 tokens per turn and shipped configurable memory limits.
- Built agent wallet and payment features: EIP-7702 session keys, passkey smart-account sign-in and x402 payments in the agent, contributing to the Cronos x402 Facilitator.

Starboard Ventures · Fullstack Blockchain Engineer Jun 2023 – Jun 2024

- Shipped Repl (now Parasail), a Filecoin DeFi protocol that reached **US$15M TVL**: ERC-1822 UUPS upgradeable contracts with Hardhat, and the design of pFIL, a stETH-style rebasing token that pays yield without a staking step.
- Built the Next.js Gnosis Safe multisig dashboard the founders used to approve protocol changes with hardware wallets, designed the signer workflow, and built the FIL/pFIL wrapping app, Prisma migrations in CI/CD and a tRPC layer.

Firerock Capital · Blockchain Engineer Jan 2022 – Jun 2023

- Cut Docker builds from **400 seconds to 10** by caching `go.mod` as its own layer and mounting the Go build cache.
- Built the Go OAuth service for binding players' social accounts (Redis, MongoDB); shipped the ERC-721/ERC-20 contracts and wired Wagmi, Web3Auth and Ethers.js into the marketplace frontend.

TikTok · Software Engineer, Video Architecture (VOD) Jan 2021 – Jan 2022

- Maintained the core playback service handling **350k QPS**, with on-call support, and built the video-metadata reconciliation service behind it (Go, RocketMQ, MySQL).
- Built Thrift RPC endpoints for internal users and scripted configuration changes to shorten turnaround.

PROJECTS

- **RightCurve**, an MCQ practice platform for Singapore O- and A-Level students, with Gemini explaining each question.
- **CasePilot**, a local-first desktop editor for litigation bundles and affidavits, built for a litigation lawyer (Tauri, Rust, React). Planned as AI drafting, built as evidence management, where AI indexes the evidence and the lawyer writes the law.
- **Wedding RSVP**, a guest-list, RSVP and seating workspace for Singapore weddings. Interviewed two people who had planned their own, mapped their workflow from guest sheet to hotel seating plan, and built it (Next.js, Supabase).

EDUCATION

Nanyang Technological University · Renaissance Engineering Programme 2017 – 2021
BEng (Hons) Computer Science, First Class; MSc Technology Management. **GPA 4.58/5.00.** REP Scholarship.

University of California, Berkeley · Junior exchange, computer science coursework 2019 – 2020

SKILLS

Programming: TypeScript / JavaScript (Node.js), Python, Go. **Languages:** English (native), Chinese (conversational).
AI: LangChain, LangGraph, OpenAI, Gemini, DeepSeek, Mistral; Claude Code and Codex with shared instructions.
Data and web: PostgreSQL, MySQL, Redis, MongoDB, Supabase, React / Next.js, Cloudflare Workers, Docker.
Web3: Solidity, Ethers.js, Wagmi, Web3Auth.
