EXPERIENCE

Singapore Financial Institution · Consulting Engineer Jun 2026 – Present

- Ran discovery on KYC screening, mapping onboarding, adverse-media screening, periodic review and audit, including the front office and compliance split. The front office raised slow, manual screening as the problem, but it turned out the compliance team, the sponsor, **needed observability and an audit trail**. Proposed a screening and review workspace where an AI first pass judges every result and drafts mitigants while **human reviewers in the loop decide the harder cases**. Every Google results page, the source their reviewers trust, is captured as evidence, and every decision is logged with its reason.
- Built a prototype, then narrowed it with the team to their web screening and its audit trail. Searches are run through Bright Data's Browser API to fetch the full Google results page and open the articles it lists. The **OpenAI Decisions API** (gpt-6-luna) quickly filters out paywalls and unreadable pages while a gpt-6.1-sol judge on the Responses API marks each article as a true hit, a false hit or needs review. In a live run on 10 names, a completed search took a **median of 3 min 22 s**. By the team's estimate, screening 10 to 20 names takes **a full day by hand**. The compliance team is championing it internally.

ArtAgain · Consulting Engineer Mar 2026 – Present

- Ran discovery with three staff when asked for an AI art valuation tool and AR tool, mapping the seller journey from WhatsApp inquiry via lead qualification and negotiation to Shopify listing, who decides each step and where work changes hands. Steps lived only in chat and people's heads, so **fixed the workflow before introducing a new art valuation tool**.
- Built the PostgreSQL database, Directus operator views and a Convex listing collaboration tool, refined on real seller submissions, and kept Shopify as their working surface. The new system replaced the listings staff's manual Google Sheet. **Cut listing time from two weeks to three days.**
- Reframed the valuation tool after sitting with the pricing staff, which showed the work was mechanical filtering in Artprice by artist, medium, edition, size and year. Rebuilt it as rule-based filters with a reason per match, used a Gemini vision model only to judge whether two auction photos show the same physical work, and left the price with the pricing staff.

Crypto.com · Senior Software Engineer, Innovation Team Jun 2024 – Jul 2026

- Worked on the AI agent's LangChain and LangGraph integration for multi-step tool use, with on-chain tools built alongside the Cronos Explorer team. When long conversations outgrew the model's context window, traced how history grew per turn and shipped configurable memory limits.
- Built agent wallet and payment features: EIP-7702 session keys, passkey smart-account sign-in and x402 payments in the agent, contributing to the Cronos x402 Facilitator.
- Built the developer platform's TypeScript and Python clients with DeFi, exchange and CronosID modules, and co-maintained the TypeScript AI agent client; each TypeScript package sees **about 3,000 npm downloads a month** (Oct 2026).

Starboard Ventures · Fullstack Blockchain Engineer Jun 2023 – Jun 2024

- Shipped Repl (now Parasail), a Filecoin DeFi protocol that reached **US$15M TVL**: ERC-1822 UUPS upgradeable contracts with Hardhat, and the design of pFIL, a stETH-style rebasing token that pays yield without a claim step.
- Built the Next.js Gnosis Safe multisig dashboard the founders used to approve protocol changes with hardware wallets, designed the signer workflow, and built the FIL/pFIL wrapping app, Prisma migrations in CI/CD and a tRPC layer.

Firerock Capital · Blockchain Engineer Jan 2023 – Jun 2023

- Cut Docker builds from **400 seconds to 10** by caching `go.mod` as its own layer and mounting the Go build cache.
- Built the Go OAuth service for binding players' social accounts (Redis, MongoDB); shipped the ERC-721/ERC-20 contracts and wired Wagmi, Web3Auth and Ethers.js into the marketplace frontend.

TikTok · Backend Software Engineer, Video Infrastructure Jan 2022 – Dec 2022 (intern Jan – Jun 2021)

- Maintained the core playback service handling **350k QPS**, with on-call support, and built the video-metadata reconciliation service behind it (Go, RocketMQ, MySQL).
- Built Thrift RPC endpoints for internal users and scripted configuration changes to shorten turnaround.

PROJECTS

- **RightCurve**, MCQ practice for Singapore O- and A-Level students, with Gemini explanations and PostHog analytics.
- **CasePilot**, a local-first desktop editor for litigation bundles and affidavits, built for a lawyer (Tauri, Rust, React). Planned as AI drafting, built as evidence management, where AI is meant to index the evidence and the lawyer writes the law.
- **Wedding RSVP**, a guest-list, RSVP and seating workspace for Singapore weddings. Interviewed two people who had planned their own, mapped their workflow from guest sheet to hotel seating plan, and built it (Next.js, Supabase).

EDUCATION

Nanyang Technological University · Renaissance Engineering Programme 2017 – 2021

BEng (Hons) Computer Science, First Class; MSc Technology Management. **GPA 4.58/5.00.** REP Scholarship.

University of California, Berkeley · Junior exchange, computer science coursework 2019 – 2020

SKILLS

Programming: TypeScript / JavaScript (Node.js), Python, Go. **Languages:** English (native), Chinese.
AI: OpenAI Codex, Claude Code, Gemini, LangChain, LangGraph. **Web3:** Solidity, Ethers.js, Wagmi, Web3Auth.
Data and web: PostgreSQL, MySQL, Redis, MongoDB, Supabase, React / Next.js, Cloudflare Workers, Docker.
